2

Definitions

- An object is a concept, abstraction, or thing that has meaning for an application.
- Each object exists and can be identified.
- Identity is "that property of an object which distinguishes each object from all others". [Khoshafian-86]
- A class is a set of objects with similar properties, common behavior (operations and state diagrams), similar relationships to other objects and common semantics.

Class Diagrams

Values and Objects

- During design, you may show internal identifiers. For example, you may use internal identifiers to clarify the design of relational database tables.

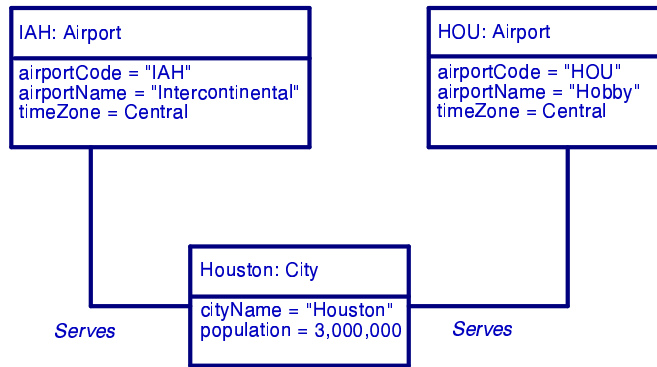

Do not show object identifiers in an analysis model.

Links and Associations

- A **link** is a physical or conceptual connection between objects.
 - most relate two objects
 - some relate three or more objects
 - is not a value
- An **association** is a description of a group of links with common structure and common semantics.
- A link is an instance of an association.
- The links of an association relate objects from the same classes and have similar properties (link attributes).

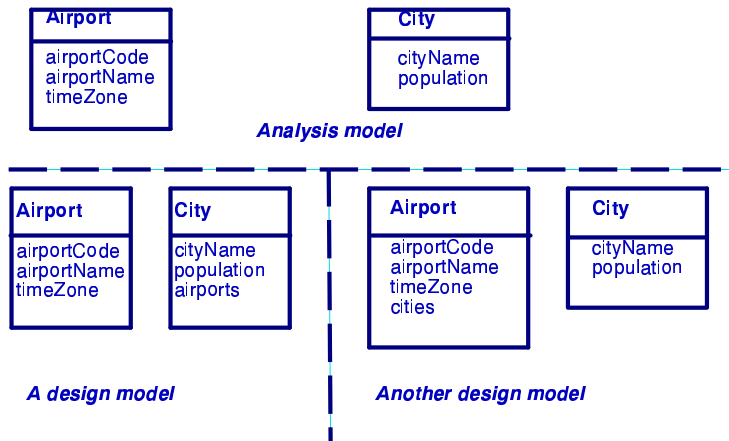

Links

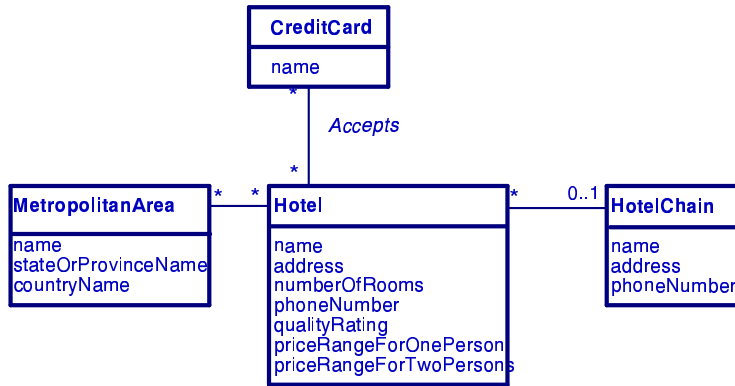

Associations

Associations Analysis and Design Models

Associations in an Object Model

Associations in an object model for hotel selection.

Multiplicity

- **Multiplicity** specifies the number of instances of one class that may relate to a single instance of an associated class.
- Constraint on the size of a collection not a count of the members.

Multiplicity - 2

Exactly One

Zero or more

Zero or one

One or More

zero or more ordered

numerical specification

Labeling multiplicity of classes in object models.

In Class Exercise

- Add the following to the hotel selection model
 - A hotel may have a number of amenities, such as restaurant, lounge, fitness center, indoor pool, outdoor pool, golf and tennis. Extend the model so that you can easily obtain the set of amenities for a given hotel and the set of hotels that offer one or more amenities.
 - Many hotels have variable pricing throughout the year; rates are low during off seasons and high during seasons of high demand. Extend the model so that it organizes pricing information by season.

Common Associations List

- A is a physical part of B
 - Drawer -- POST
 - Wing -- Airplane
- A is a logical part of B
 - SalesLineItem -- Sale
 - FlightLeg -- FlightRoute
- A is physically contained in/on B
 - POST -- Store, Item -- Shelf
 - Passenger -- Airplane
- A is logically contained in B
 - ItemDescription -- Catalog
 - Flight -- FlightSchedule
- A is a description for B
 - ItemDescription -- Item
 - FlightDescription -- Flight

Common Associations List -- 2

- A is a line item of a transaction or report B
 - SalesLineItem -- Sale
 - MaintenanceJob -- MaintenanceLog
- A is known/logged/recorded/captured in B
 - Sale -- POST
 - Reservation -- FlightManifest
- A is a member of B
 - Cashier -- Store
 - Pilot -- Airline
- A is an organizational subunit of B
 - Department -- Store
 - Maintenance -- Airline
- A uses or manages B
 - Cashier -- POST
 - Pilot -- Airplane

Common Associations List -- 3

- A communicates with B
 - Customer -- Cashier
 - ReservationAgent -- Passenger
- A is related to a transaction B
 - Customer -- Payment
 - Passenger -- Ticket
- A is a transaction related to another transaction B
 - Payment -- Sale
 - Reservation -- Cancellation
- A is next to B
 - POST -- POST
 - City -- City
- A is owned by B
 - POST -- Store
 - Plane -- Airline

Association Guidelines

- How detailed should associations be?
 - Common pitfall in creating conceptual models is to spend too much time during investigation trying to discover them.
 - Finding concepts is much more important than finding associations. The majority of time spent in conceptual model creation should be devoted to indentifying concepts, not associations.
- Focus on those associations for which knowledge of the relationship needs to be preserved for some duration (need-to-know) associations).
- It is more important to identify concepts than to identify associations.
- Too many associations tend to confuse a conceptual model rather than illuminate it. Their discovery can be time consuming, with marginal benefit.
- Avoid showing redundant or derivable associations.

Carnegie Mellon

20

04_Object_Modeling.ag

20 of 32

February 27, 2000

Roles

- Each end of an association is called a role.
- Roles may optionally have:
 - name
 - multiplicity expression
 - navigability

Carnegie Mellon

21

04_Object_Modeling.ag

21 of 32

February 27, 2000

Naming Associations

- Name an association based on a **ClassName-VerbPhrase-ClassName** format where the verb phrase creates a sequence that is readable and meaningful in the model context.
- Store Example

Carnegie Mellon

22

Association Names

Airline Example

Carnegie Mellon

04_Object_Modeling.ag

23 of 32

February 27, 2000

23

Relate with Associations not Attributes

Bad Design
Resulting DB is not in normal form
 not a "simple" attribute

Better

Carnegie Mellon

04_Object_Modeling.ag

24 of 32

February 27, 2000

24

Complex Domains as Associations

Bad design
Resulting Data Base is
not in normal form.

Destination is a complex concept

Better

Carnegie Mellon

25 of 32

February 27, 2000

25

Multiple Associations Between Classes

(Not every flight is guaranteed to land at an airport!)

Carnegie Mellon

04_Object_Modeling.ag

26 of 32

February 27, 2000

26

Design Creep: No Attributes as Foreign Keys

- Attributes should not be used to relate concepts in conceptual models or models created for database systems.
- **DO NOT** add foreign key attributes to associate two types -- use an association instead.

simple attribute used as a
foreign key to relate to
another object

POOR DESIGN
Use a Foreign Key to relate
to another object.

Carnegie Mellon

04_Object_Modeling.ag

27 of 32

February 27, 2000

27

Modeling Quantities

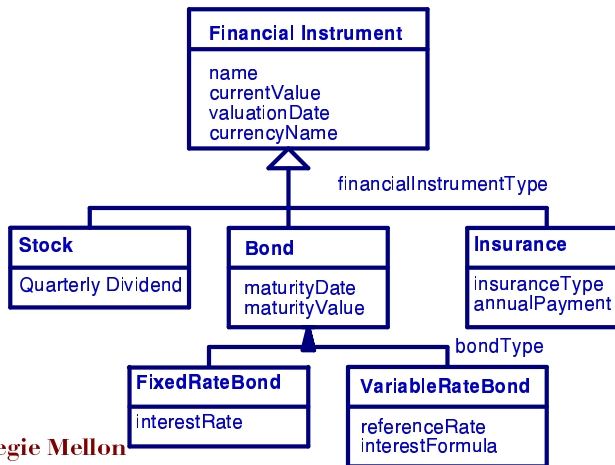

Usable, but not flexible or robust

Better

Generalization

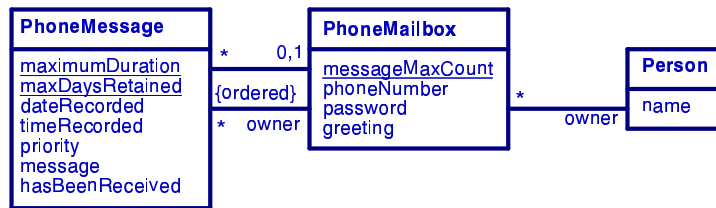

Attributes and Operations

- Class attributes
 - one copy for shared by all instances of a class
 - Example: **static** attributes of Java Classes
 - Underline names in class diagrams
- Class operations
 - operation on a class rather than on a member of the class (an object)
 - Example: **new** operation of Java
- Class Instance
 - An object that is a member of a class
 - Example: the return value of the operation **new** in Java

Avoid Class Attributes

- Model Groups Explicitly
- Using class attributes imposes restrictions
 - All class instances must have the same value for these attributes
 - Prevents adding different restrictions later

Model Groups Explicitly

POOR DESIGN

All users have same
maximumDuration
maxDaysRetained
messageMaxCount

Can't change these for individual users or for periods of time
