

**Sanghun Jeon** received Ph.D. degrees (with the best paper award) in electronic materials program from Gwangju Institute of Science and Technology, Gwangju, Korea, in 2003, working on metal-oxide-semiconductor device with high-k gate insulator and metal gate. In 2003, he was with Samsung Advanced Institute of Technology, Giheung, Korea, where he had been working on nanomemory research projects including charge-trap Flash (CTF) memory, resistive RAM, and multibit memory devices. In 2005, he was a Process Integration Engineer and a Device Engineer with the Advanced Technology Development team of Samsung Electronics Corporation, where he had been responsible for 8-, 16-, and 32-Gb NAND-type CTF memory devices. In 2009, he returned to Samsung Advanced Institute of Technology, where he worked on graphene, 3-D stacked devices, and wide band-gap oxide thin-film transistor for various device applications. He published more than 60 international journal papers, 60 conference papers, and extended abstracts in the field of Si transistor technology, memory devices, thin-film transistors, flexible device, and phototransistor. He also applies and currently holds (54+120) patents related to novel device and materials including Flash memory device, printed device, organic materials, transparent oxide, graphene, image sensor, photo sensor arrays, novel semiconductor device, and 3-D vertical devices. He is currently associate professor at Korea University. \*\* jeonsh@korea.ac.kr
