

Sustainability and the Future of Moore's Law

Carolyn R. Duran

Components Research Process Engineering, Intel

Abstract

The semiconductor industry has a great track record as we have driven innovation in the pursuit of Moore's Law, and this continues today and into our future. However, in recent times we have recognized that delivering to Moore's Law is **necessary** but **not sufficient** for our collective futures, and we need to and that we need to simultaneously solve sustainability. In her talk, Dr. Duran will share Intel's approach to environmental stewardship and committed goals. Within that framework, Dr. Duran will focus on critical materials and process research areas that can affect positive change.
