

Chemistry

→ stability of atoms → full outer shell

ions → gain or lose electrons to give a full shell

bonds (covalent)

Carbon - 6e

Carbon

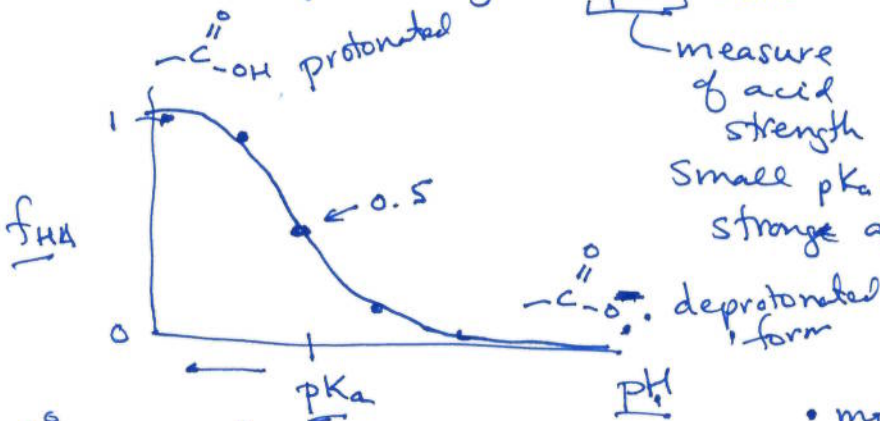

four diff groups → chiral

pH: $\text{pH} = -\log \text{H}^+$

low pH ⇒ high $[\text{H}^+]$

f_{HA} - fraction protonated.

⇒ predict given pK_a acid

two mirror images (enantiomer)

↳ may have diff biological effects

• molecules with no charges can pass through membranes.

Biology

- Prokaryotic cells
- Eukaryotic cells
- Virus

compare & contrast
differences
&
similarities

→ organelle function
- ribosome, golgi, Endo reticulum.

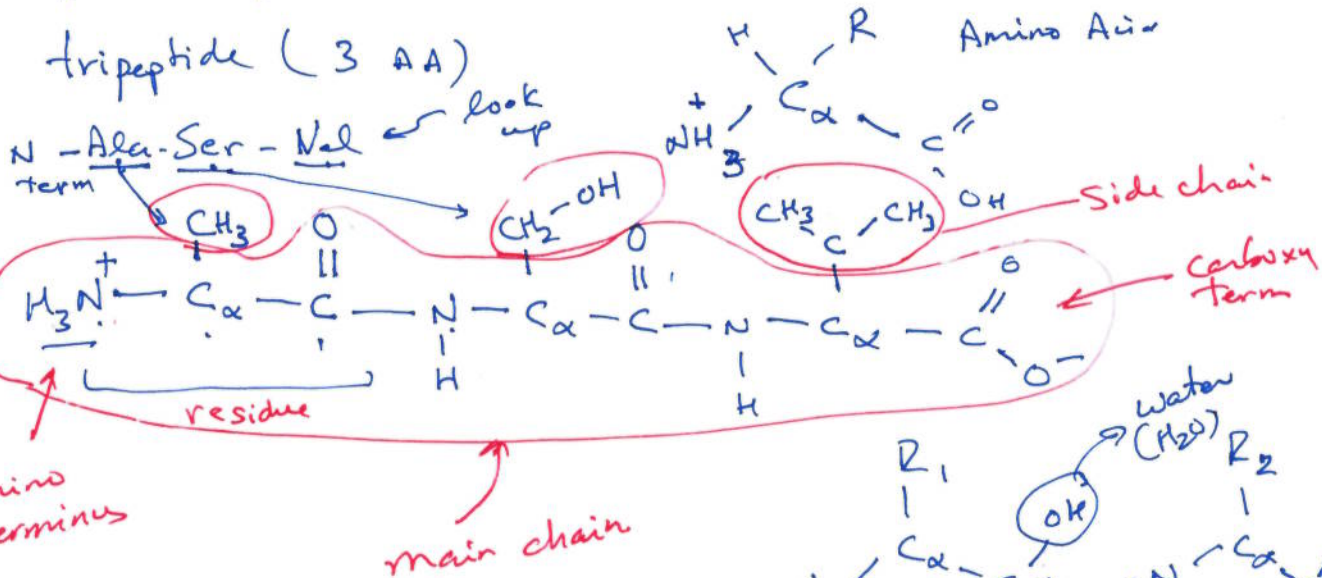

Protein structure

functional forms

- primary - A.A. Sequence (N → C term) (1)
- Secondary - main chain structures (α-helix, β-sheet) (1)
- tertiary - complete structure one chain (all proteins) (folded form)
- quaternary - multiple chain (Ab)

Primary

tripeptide (3 AA)

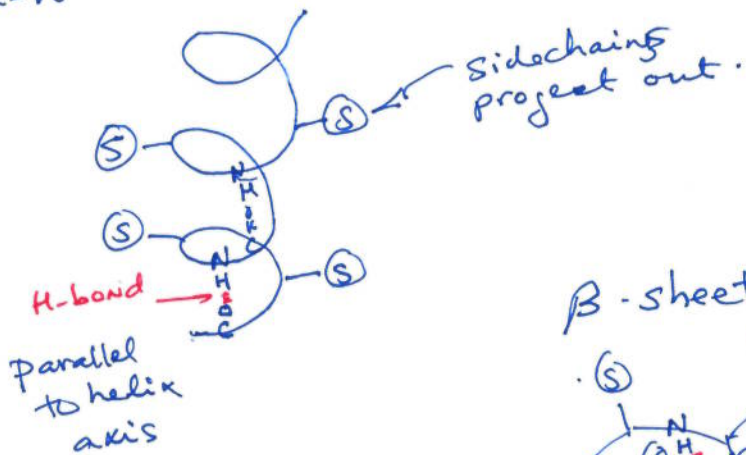

Secondary

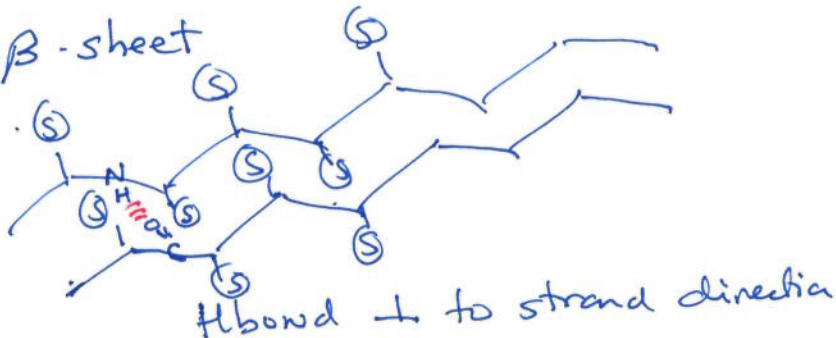

- main chain H-bonds

α-helix

β-sheet

Pollen

E. coli

flu
