Why Unit Test?

- Prevents subtle bugs in large software
- Makes writing lots of tests easier
- Makes running lots of tests easier
- Convince others your code is bug free
- Convince yourself that somebody else's code is bug free

Types of unit tests

- 1) Basic cases
 - I) Test cases that should come out positive
 - II) Test cases that should come out negative
 - III) If doc specifies something should happen, write a test for it.
- 2) Bad Input
 - I) Null Cases
 - II) NaN/ +infinity/-infinity
 - III) Check that exceptions are thrown in right places.
- 3) Edge Cases
 - I) Test maximum and minimum inputs
 - II) Zero sized arrays

Types of unit tests

- 1) Stress Test
 - I) Test random inputs for large cases that you can't do yourself.
 - II) Always use a static seed (or a few)! Otherwise You might not be able to reproduce the error.
 - a. Use: `Random m=new Random(5);`
 - b. Not: `Math.random()`
- 2) Timed Tests
 - I) Make sure that programs halt when they should.
 - II) Impossible to write a program to tell if another program stops (There is no oracle for the halting set)
 - III) Instead, you can time how long things take

JUnit functionality

Operation	Functionality
<code>assertTrue(boolean arg)</code>	Ensure arg is true
<code>assertFalse(boolean arg)</code>	Ensure arg is false
<code>assertEqual(A, B)</code>	Ensure object A is equal to object B (using <code>.equals()</code>)
<code>assertNotNull(A)</code>	...
<code>assertSame(A, B)</code>	Ensure <code>A==B</code> (checks if they point to the same object)
<code>assertArrayEquals(A, B)</code>	Ensure each element in A equals the same element in B (using <code>.equals()</code>)
<code>fail()</code>	Always fails.

Normal Test

```
@Test
public void doStuff() {
    System.out.println("this is a JUnit test");
    assertTrue(true);
}
```

Expecting an exception

```
@Test(expected = NullPointerException.class)
public void nullTest() throws Exception {
    KevinBaconGameSolver.createUnweightedGameSolver(null);
}
```

Timed

```
@Test(timeout = 1000) //timeout is in ms
public void createQueueTest ()
{
    Queue<Object> q = new ArrayQueue<Object> ();
    assertEquals("Create new queue, call size()", 0, q.size ());
    assertEquals("Create new queue, call peek()", null, q.peek ());
    assertEquals("Create new queue, call poll()", null, q.poll ());
}
```
