

BME 42-620 Engineering Molecular Cell Biology

Lecture 23:

Cell Cycle (II)

*Chapter 17*

# Final Exam Schedule

---

Group ID	Students	Paper	Time & Location
1	Wing Chiu Tam, Zixuan He, Jian Zhang		
2	Kenneth Yan, April Watt, Daniel Engel	Shimamoto et al, <i>Cell</i> , 2011	Dec. 16, 10:30AM Mellon Institute 411
3	Rebecca Duffy, Kevin Kennedy, Stephanie Wong	Levy et al, <i>Cell</i> , 2010	Dec. 11, 9:00AM Mellon Institute 411
4	Priti Albal, Arun Sampath, Madhumitha Raghu, Sombeet Sahu		
5	Jackie Chen, Jaclyn Brackett, Pitirat Pholpabu		
6	Simone Costa, Christine Bronikowski, James Rockwell		

# Final Exam Papers

---

- 1) R. Delanoue & I. Davis, Dynein anchors its mRNA cargo after apical transport in the *Drosophila* blastoderm embryo, *Cell*, 122:97-106, 2005.
- 2) D. Levy & R. Heald, Nuclear size is regulated by importin  $\alpha$  and Ntf2 in *Xenopus*, *Cell*, 143:288-298, 2010.
- 3) S. Ally, A. G. Larson, et al, Opposite-polarity motors activate one another to trigger cargo transport in live cells, *Journal of Cell Biology*, 187:1071-1082, 2009.
- 4) Y. Shimamoto, Y. T. Maeda, et al, Insights into the micromechanical properties of the metaphase spindle, *Cell*, 145:1062-1074, 2011.
- 5) C. A. Wilson, M. A. Tsuchida, et al, Myosin II contributes to cell-scale actin network treadmilling through network disassembly, *Nature*, 465:373-377, 2010.
- 6) A. Levskaya, O. D. Weiner, W. A. Lim, C. A. Voigt, Spatiotemporal control of cell signaling using a light-switchable protein interaction, *Nature*, 461:997-1001, 2009.

# Outline

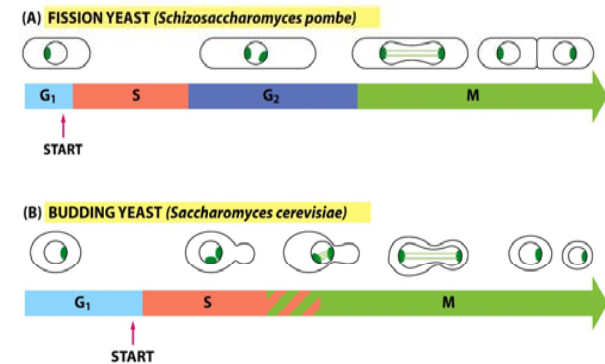

---

- Overview of cell cycle
- Different phases of cell cycle
- Checkpoints; Cyclin and cyclin-dependent kinases
- A detailed look at M phase
- Quantitative system-level study of cell cycle
- Outlook

- 
- Overview of cell cycle
  - Different phases of cell cycle
  - Checkpoints; Cyclin and cyclin-dependent kinases
  - A detailed look at M phase
  - Quantitative system-level study of cell cycle
  - Outlook

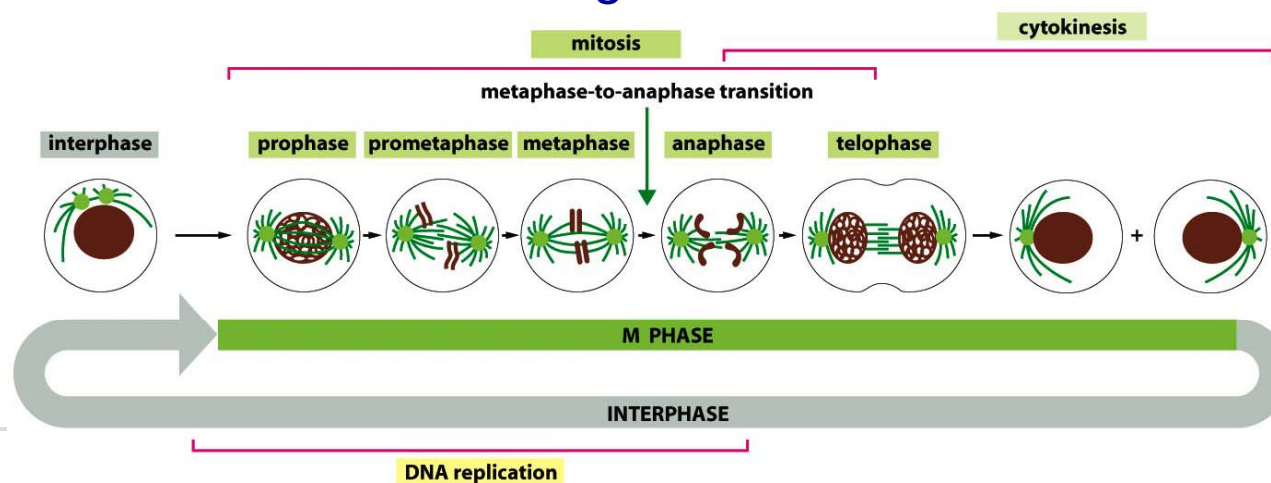

# Overview of Cell Cycle (I)

- The cell cycle is a series of events that leads to the replication and division of a cell.
- Two daughter cells inherit the same genetic information from the mother cell.
- Cell cycle must be tightly regulated.
- Basic mechanisms of cell cycle regulation are well conserved in eukaryotes.

# Overview of Cell Cycle (II)

- Cell cycle is controlled by a series of biochemical switches (checkpoints).
- Multiple layers of regulation ensures fidelity of cell division by responding to internal and external signals.
- In addition to replicating their genome, most cells replicate their other organelles and macromolecules.
- Growth in cell mass must be regulated too.

- 
- Overview of cell cycle
  - **Different phases of cell cycle**
  - Checkpoints; Cyclin and cyclin-dependent kinases
  - A detailed look at M phase
  - Quantitative system-level study of cell cycle
  - Outlook

# Phases of Cell Cycle (I)

- $G_1$  phase

- Grow in cell mass
- Genes required to activate cell cycle are turned off
- Can be delayed
- Can exit to  $G_0$

- $G_0$  and growth control

- Cells no longer divide
- Can exit from  $G_0$
- Cells are active in  $G_0$

# Phases of Cell Cycle (II)

- S phase
  - Centrosome replication
  - DNA replication
  - Sister chromatids are connected by cohesin
- G<sub>2</sub> phase
  - To check for unreplicated or damaged DNA
  - To prepare for mitosis (e.g. accumulation of enzymes)

# Phases of Cell Cycle (III)

- M phase

- prophase:

- condensation of chromosomes; formation of two poles

- prometaphase

- nuclear envelope breakdown; bipolar attachment at kinetochores

- metaphase

- chromosomes aligned in the midzone

- anaphase

- sister chromatids separated; moving to the two poles

- telophase

- reformation of nuclear envelopes

- cytokinesis

- formation of contractile ring; separation of two daughter cells

- 
- Overview of cell cycle
  - Different phases of cell cycle
  - **Checkpoints; Cyclin and cyclin-dependent kinases**
  - A detailed look at M phase
  - Quantitative system-level study of cell cycle
  - Outlook

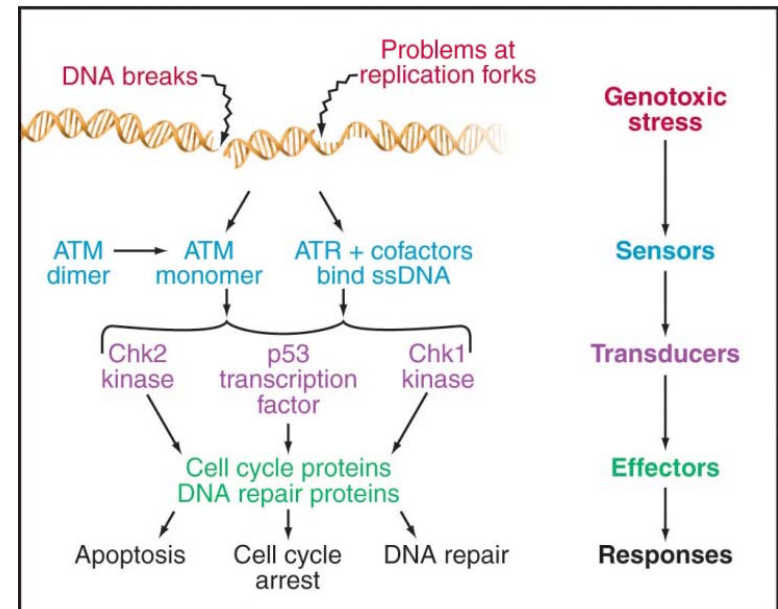

# Checkpoints (I)

- Check points are biochemically implemented switches that control transition between cell-cycle stages
- Restriction point in G1 phase
- DNA damage checkpoint in G1, S, G2 phase
- DNA replication checkpoint
- Spindle assembly checkpoint

# Checkpoints (II)

- DNA damage check point
- Sensing of DNA damage: ATM & ATR
- ATM & ATR activate Chk1& Chk2 and stabilizes p53.
- Cell-cycle progression is halted if DNA damage is detected.

- Cells can enter into several states
    - Cell death
    - Cell cycle arrest
    - Successful DNA repair;  
Resume cell cycle
- ATM: ataxia-telangiectasia mutated  
ATR: ataxia-telangiectasia and Rad9 related

# Cyclin and Cyclin-Dependent Kinase (I)

- Transition between different stages of the cell cycle are controlled by a network of kinases and phosphatases.
- Cyclin-dependent kinases play critical roles in regulating cell cycle.

# Cyclin and Cyclin-Dependent Kinase (II)

**Table 17–1 The Major Cyclins and Cdks of Vertebrates and Budding Yeast**

CYCLIN-CDK COMPLEX	VERTEBRATES		BUDDING YEAST	
	CYCLIN	CDK PARTNER	CYCLIN	CDK PARTNER
G <sub>1</sub> -Cdk	cyclin D*	Cdk4, Cdk6	Cln3	Cdk1**
G <sub>1</sub> /S-Cdk	cyclin E	Cdk2	Cln1, 2	Cdk1
S-Cdk	cyclin A	Cdk2, Cdk1**	Clb5, 6	Cdk1
M-Cdk	cyclin B	Cdk1	Clb1, 2, 3, 4	Cdk1

**\* There are three D cyclins in mammals (cyclins D1, D2, and D3).**

**\*\* The original name of Cdk1 was Cdc2 in both vertebrates and fission yeast, and Cdc28 in budding yeast.**

# Cyclin and Cyclin-Dependent Kinase (III)

- CAK (cdk-activating kinase) activates cyclin-CDK complexes.
- Activated cyclin-CDK complexes can be inhibited by Cdk inhibitor proteins (CKI) or inhibitory phosphorylation.
- Redundant mechanisms used to ensure robustness and fidelity of cell-cycle control.

# Protein Degradation in Cell Cycle (I)

---

- Protein degradation is a critical cell cycle regulatory mechanism.
- Exit from mitosis requires CDK inactivation
- This is achieved by degradation of cyclins and securin (regulator of sister chromatid separation).
- Destruction of cyclins inactivate CDKs.
- Degradation of cyclin is performed in proteasome and requires ubiquitin enzymes (E1, E2, E3).

# Protein Degradation in Cell Cycle (II)

- Example: a key regulator of cyclin degradation is APC/C (anaphase promoting complex/cyclosome).
- Two forms of APC/C
  - APC/C<sup>Cdc20</sup>
  - APC/C<sup>Cdh1</sup>
- APC/C<sup>Cdc20</sup> is responsible for triggering metaphase-anaphase transition.

# Summary of Cell Cycle Regulatory Proteins

**Table 17–2 Summary of the Major Cell-Cycle Regulatory Proteins**

GENERAL NAME	FUNCTIONS AND COMMENTS
<b>Protein kinases and protein phosphatases that modify Cdks</b>	
<b>Cdk-activating kinase (CAK)</b>	phosphorylates an activating site in Cdks
<b>Wee1 kinase</b>	phosphorylates inhibitory sites in Cdks; primarily involved in suppressing Cdk1 activity before mitosis
<b>Cdc25 phosphatase</b>	removes inhibitory phosphates from Cdks; three family members (Cdc25A, B, C) in mammals; primarily involved in controlling Cdk1 activation at the onset of mitosis
<b>Cdk inhibitor proteins (CKIs)</b>	
<b>Sic1 (budding yeast)</b>	suppresses Cdk1 activity in G <sub>1</sub> ; phosphorylation by Cdk1 at the end of G <sub>1</sub> triggers its destruction
<b>p27 (mammals)</b>	suppresses G <sub>1</sub> /S-Cdk and S-Cdk activities in G <sub>1</sub> ; helps cells withdraw from cell cycle when they terminally differentiate; phosphorylation by Cdk2 triggers its ubiquitylation by SCF
<b>p21 (mammals)</b>	suppresses G <sub>1</sub> /S-Cdk and S-Cdk activities following DNA damage
<b>p16 (mammals)</b>	suppresses G <sub>1</sub> -Cdk activity in G <sub>1</sub> ; frequently inactivated in cancer
<b>Ubiquitin ligases and their activators</b>	
<b>APC/C</b>	catalyzes ubiquitylation of regulatory proteins involved primarily in exit from mitosis, including securin and S- and M-cyclins; regulated by association with activating subunits
<b>Cdc20</b>	APC/C-activating subunit in all cells; triggers initial activation of APC/C at metaphase-to-anaphase transition; stimulated by M-Cdk activity
<b>Cdh1</b>	APC/C-activating subunit that maintains APC/C activity after anaphase and throughout G <sub>1</sub> ; inhibited by Cdk activity
<b>SCF</b>	catalyzes ubiquitylation of regulatory proteins involved in G <sub>1</sub> control, including some CKIs (Sic1 in budding yeast, p27 in mammals); phosphorylation of target protein usually required for this activity

- 
- Overview of cell cycle
  - Different phases of cell cycle
  - Checkpoints; Cyclin and cyclin-dependent kinases
  - **A detailed look at M phase**
  - Quantitative system-level study of cell cycle
  - Outlook

# Overview of M Phase (I)

- In metaphase cells undergo dramatic and complex changes in its structure and organization. Only apoptosis is comparable.

- Mitosis is the most complex process in the cell cycle.

A. Interphase	B. Prophase	C. Prometaphase	D. Metaphase
<p>Nucleus Microtubules</p>	<p>Centrosome Chromosomes</p>	<p>NE</p>	
Centrosomes separate Chromosomes condense	Nuclear envelope (NE) breaks down Chromosomes attach to spindle	Chromosomes align on spindle equator	
E. Anaphase A	F. Anaphase B	G. Telophase	H. Cytokinesis
	<p>CS CF Pole</p>	<p>NE CS CF</p>	<p>Midbody CS remnant</p>
Sister chromatids separate and move to poles	Organized central spindle (CS) assembles Cleavage furrow (CF) assembles Poles (arrows) separate	Cleavage furrow (CF) constricts Nuclear envelope (NE) reassembles	Chromosomes decondense Interphase microtubule network reforms Daughter cells separate

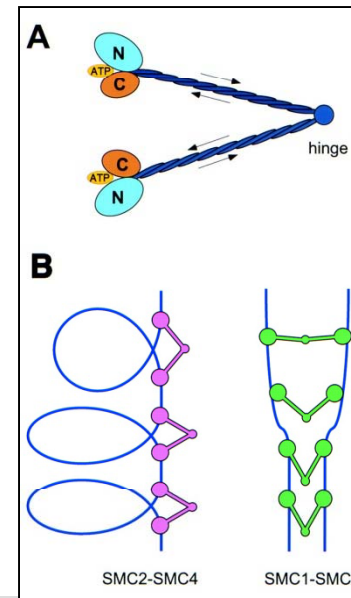

# Overview of M Phase (II)

- Cell division is usually symmetric.
- An important exception is the asymmetric division of stem cells.
- Key regulators of metaphase include Cdk2-cyclin A, Cdk1-cyclin B and APC/C<sup>Cdc20</sup>.

# Prophase (I)

- Prophase is the transition phase of  $G_2$  into mitosis.
- Chromosome condensation
  - H1 and H3 are phosphorylated by Cdk1 and Aurora-B, respectively.
  - Condensin enters nucleus.
  - These activities are not essential for chromosome condensation.
- Disassembly of nucleolus

Hirano T, *Genes Dev.* 1999;13:11-19

# Prophase (II)

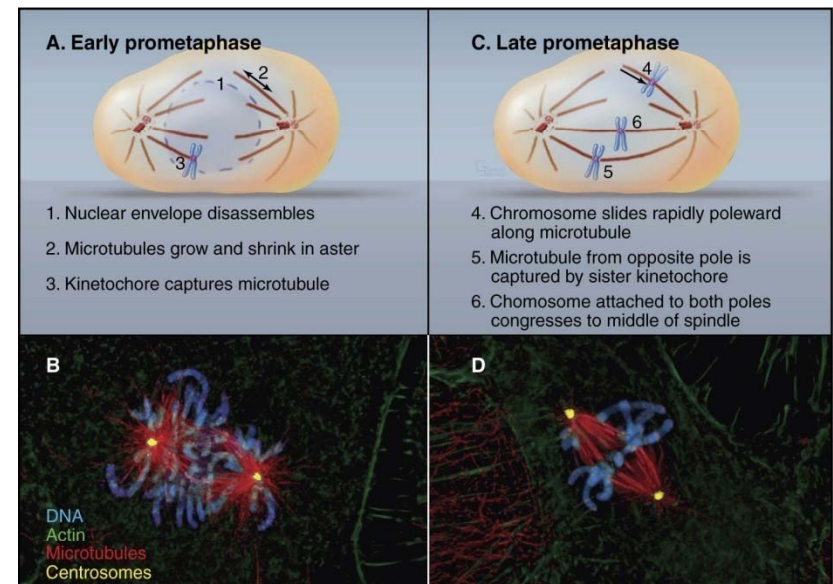

- Microtubules
  - Microtubules become more dynamic and much shorter.
  - Increased nucleation at centrosomes.
  - Microtubules become organized into two radial arrays.
- Intermediate filaments and actin disassemble.
- Transcription stops.
- Intracellular organelles
  - Golgi and ER fragment.
  - Membrane-mediated events greatly decrease.
- Cell surface
  - Endocytosis and exocytosis are suppressed.
  - Surface receptors are internalized.
- Cell shape becomes rounded.

# Overview of Prometaphase

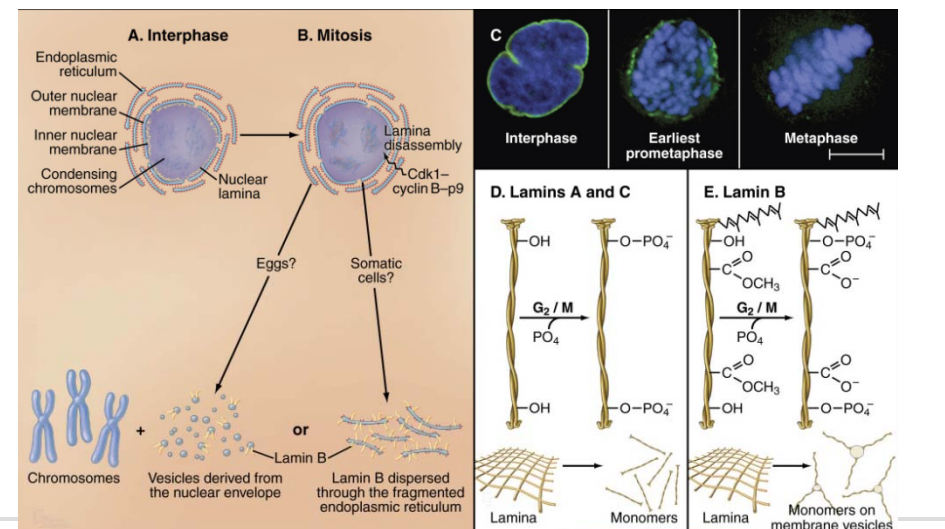

- Major events

- Nuclear envelope breaks down.
- Capture of chromosomes by MTs.
- Chromosomes establish bipolar attachment at kinetochores.
- Correction of attachment errors under the control of spindle checkpoint molecules.

# Prometaphase: Nuclear Envelope Breakdown

- Nuclear membrane bilayers are removed.
- Nuclear pores disassemble.
- Nuclear lamina meshwork disassemble.
- Broken nuclear envelope components are organized differently in different cells.

# Prometaphase: Mitotic Spindle Organization (I)

- Three groups of microtubules
  - Kinetochore MTs
  - Interpolar MTs
  - Astral MTs
- Molecular motors play critical roles in maintaining the dynamic architecture of the mitotic spindle.

# Prometaphase: Mitotic Spindle Organization (II)

- Constant addition of tubulin at MT plus ends is balanced by depolymerization at MT minus ends. This generates microtubule flux.

mitotic spindle

Yang et al., *J. Cell Biology*, 182:631-639, 2008

# Spindle Assembly: MT Organization (I)

- Two pathways of microtubule assembly
  - Centrosome-mediated assembly
  - Centrosome-independent assembly

- Centrosome-independent spindle assembly depends on a Ran-GTP gradient.

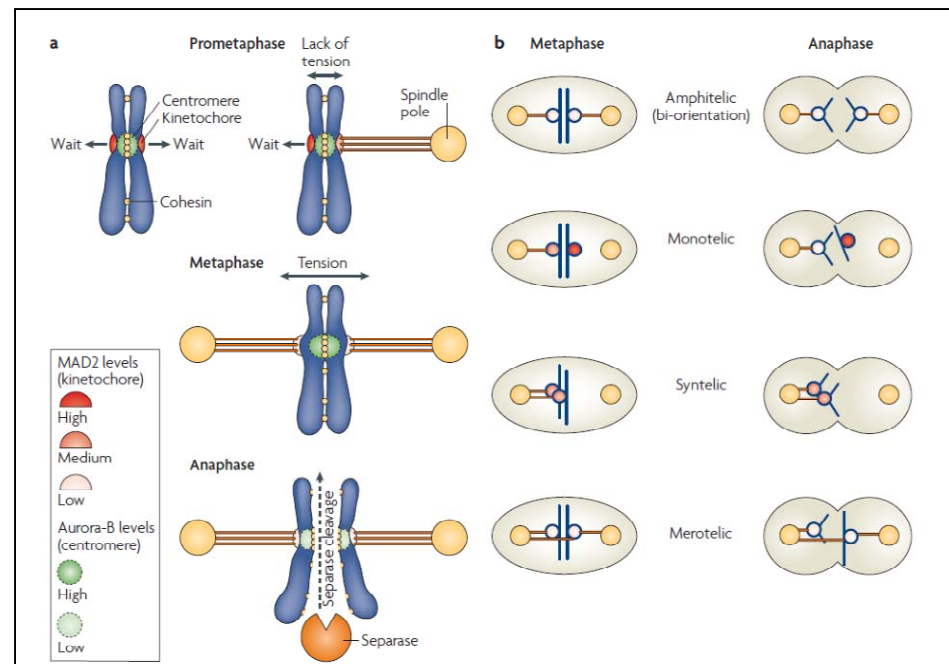

# Spindle Assembly: Bipolar Attachment (II)

- Two mechanisms to establish bipolar attachment of microtubule and chromosomes
  - Search and capture
  - Chromosome mediated MT growth

# Error Correction & Spindle Checkpoint

- Tension between sister chromatids is essential to error detection and correction.
- MAD1/2 & Aurora-B kinase play critical roles in spindle checkpoint.

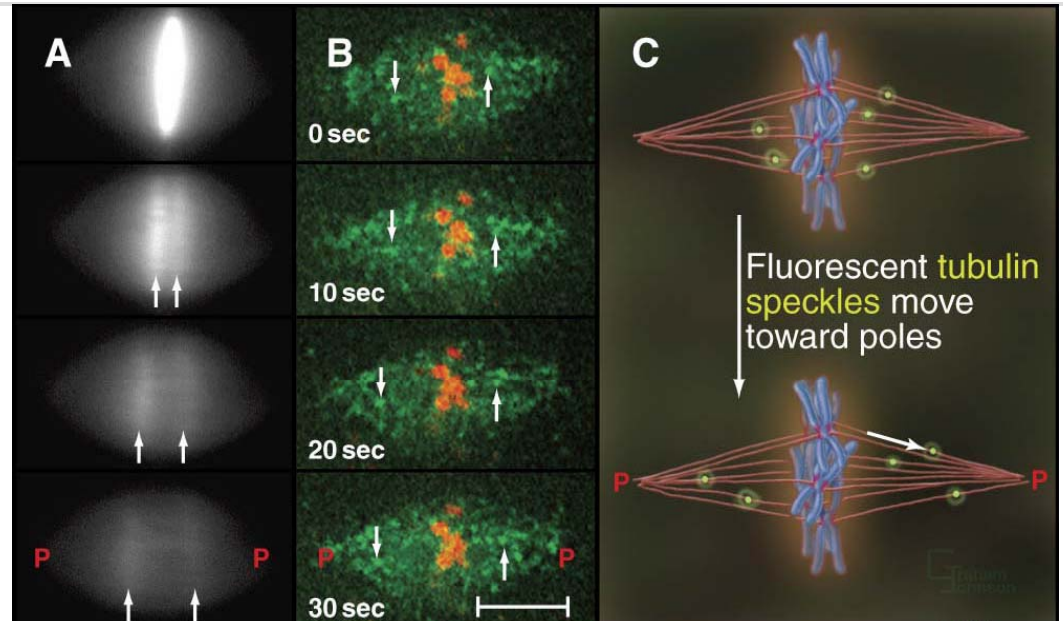

Musacchio & Salmon, *Nat. Rev. Mol. Cell Biol.*  
8:319, 2007.

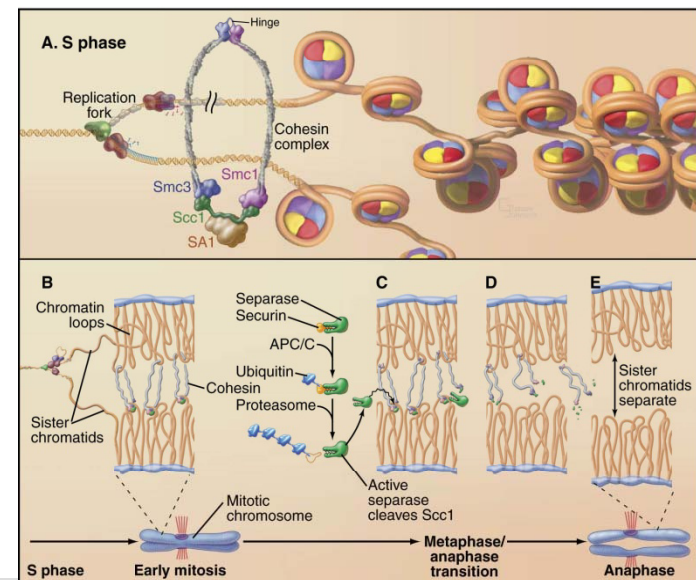

# Metaphase

- Chromosomes become aligned at the metaphase plate.
- Microtubules undergo constant poleward flux.
- Chromosomes oscillate during metaphase.
- APC/C promotes the degradation of securin.

# Anaphase A

- Movement of sister chromatids to the poles requires shortening of kinetochore MTs.
- Anaphase A follows activation of APC/C<sup>Cdc20</sup>.
- After spindle checkpoint is turned off, APC/C<sup>Cdc20</sup> triggers the degradation of securin.
- Reduced securin level allows separase to cleave cohesin.

# Anaphase B

- Spindle elongation pushes spindle poles apart in Anaphase B.
- Chromosome movement is driven by two factors
  - microtubule shortening and growth
  - microtubule flux
- Spindle elongation
  - Antiparallel sliding of microtubules
  - Microtubule growth
  - Spindle pole motility

# Telophase

- Nuclear envelope starts to reassemble in late anaphase and is completed in telophase.
- Ran-GTP mediates nuclear envelope assembly.
- Nuclear lamina reassembles through recycling of disassembled lamin subunits.

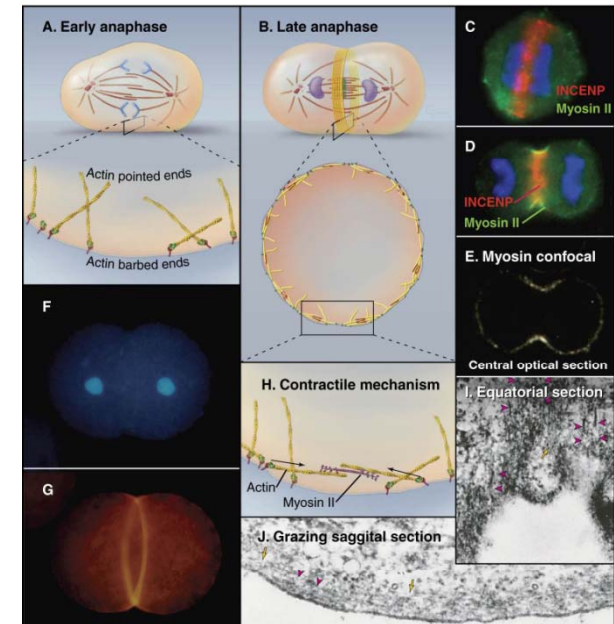

# Cytokinesis (I)

- Two daughter cells become separated through cytokinesis.
- Formation of the contractile ring requires actin and myosin-II.
- Separation of two daughter cells is accompanied by constriction and disassembly of the contractile ring.

# Cytokinesis (II)

- Cytokinesis requires membrane addition and abscission.
- Secretory vesicles from the Golgi provides new membrane.
- Midbody contains many proteins involved in membrane trafficking.
- Intracellular bridges may remain open to connect cells.

# Exit From Mitosis

- Cdk1 must be inactivated for exit from mitosis.
- Much of what is known of exit from mitosis comes from budding yeast.
- Exit from mitosis in yeasts is mediated by the MEN GTPase.
- Lowered Cdk activities allow the release of MEN GTPases.
- Released MEN GTPases activate Cdc14p, which inhibits Cdks.

# Outlook

---

- Rigorous training in cellular and molecular biology is essential to biomedical engineering education.
  - Like just about any field, the most effective way to learn biology is to actually do it.
- A follow-up course: 03-741 Advanced Cell Biology
- Other possible follow-up courses
  - Biophysics
  - Biochemistry
  - Molecular biology
  - Genetics
  - Computational biology
