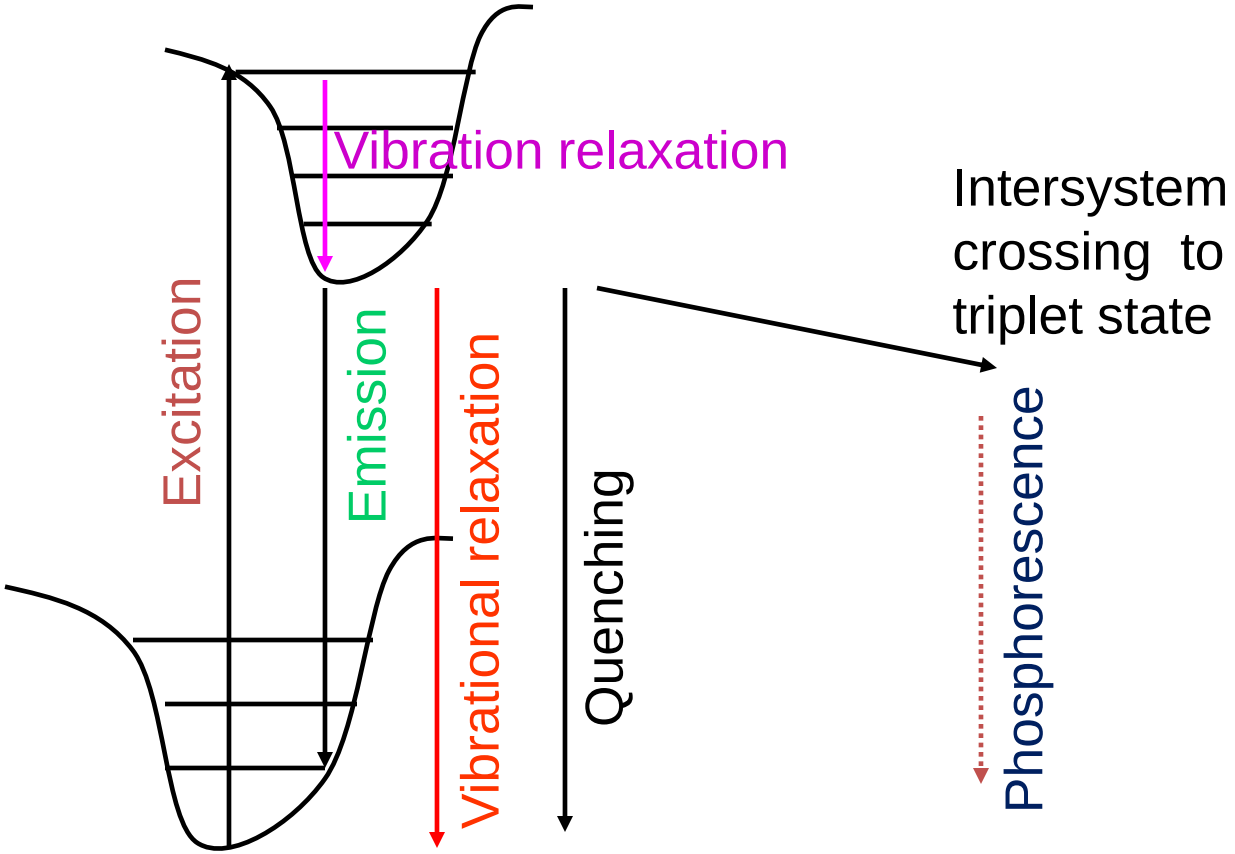
Fluorescence Microscopy

- Started at the turn of the 20th century as one of the contrast generating methods
- Early applications used primarily histological stains, conceptually similar to bright field microscopy
- Noted for its introduced labels against a dark background, and the associated specificity and sensitivity
- Molecular targeting started with the introduction of fluorescently tagged antibodies by Coons in 1950, turning it from a morphological into a molecular tool

What is Fluorescence

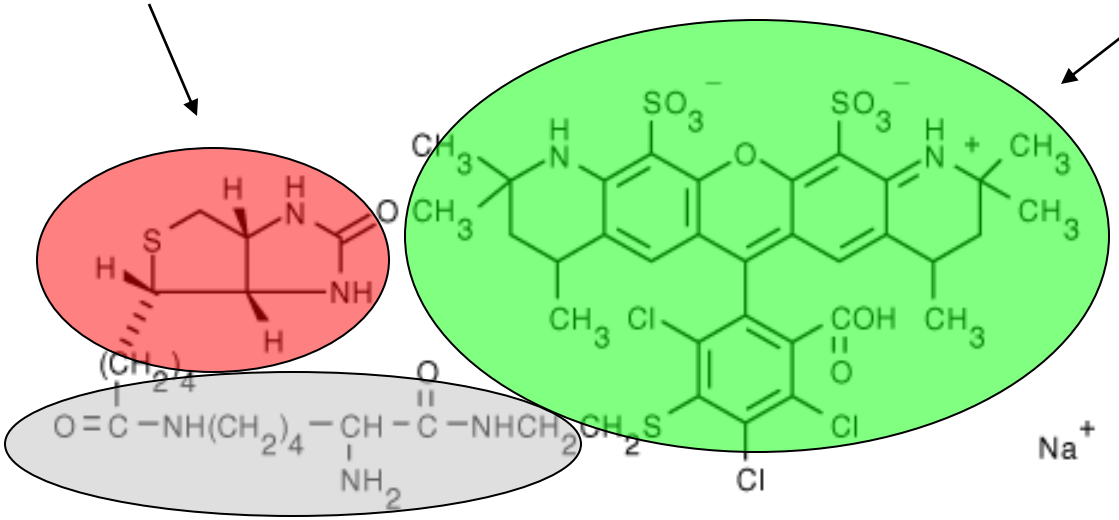
Emission of photons as a molecule returns from singlet excitation state to ground state



Anatomy of Organic Fluorescent Probes

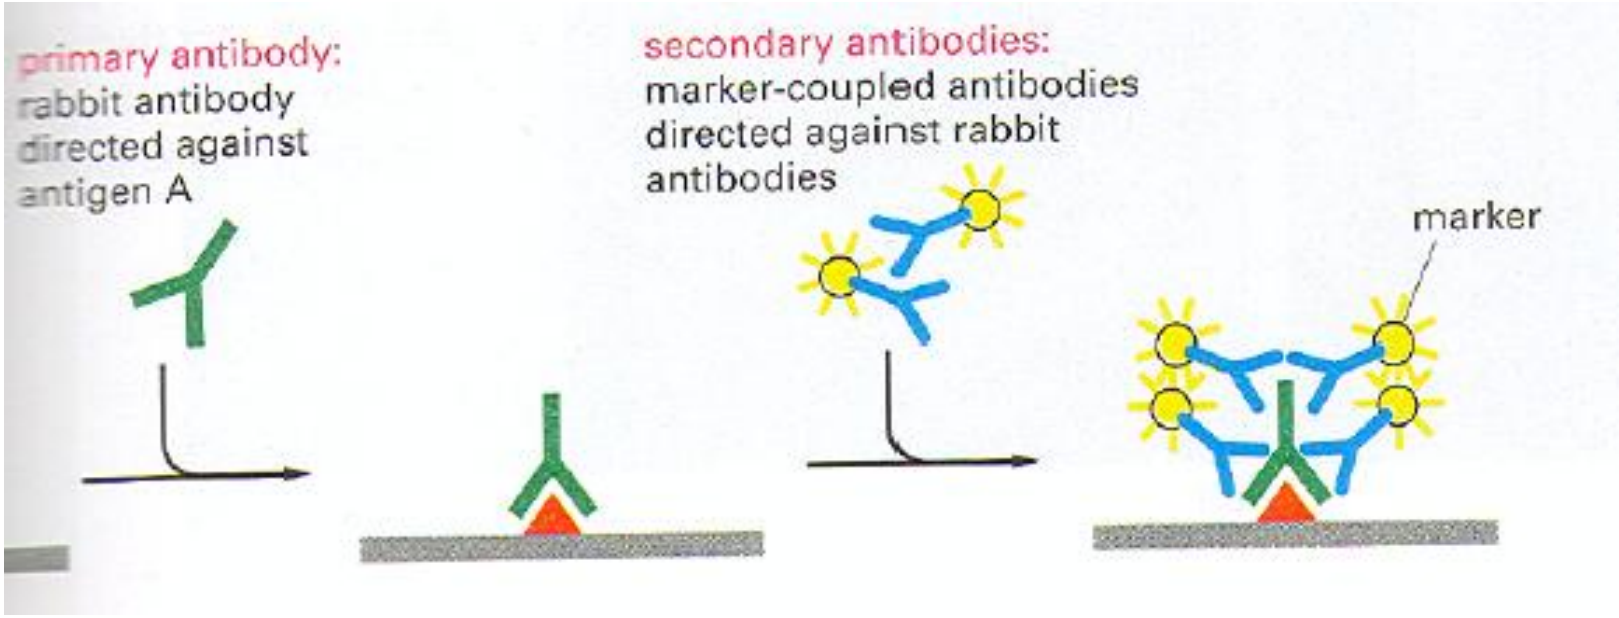
Reactive/binding moiety (biotin)

Alexa-546 fluorophore



Spacer

Immunofluorescence



Factors that Affect Fluorescence Microscopy

- **Photobleaching** –fading of fluorescence, as a result of chemical reactions of the excited state. Typically involves triplet state and oxygen and irreversible.
- **Photodamage** – creation of toxic molecules by excited fluorophores. Typically involves photobleaching and free radical generation.
- **Quenching** – non-radiative processes that dissipate the energy of the excited state. Typically involves non-covalent molecular interactions and reversible.
- **Autofluorescence** – fluorescence emitted by molecules other than the probes. Could be from co-enzymes, media, glass, immersion oil.
- **Background fluorescence** – diffuse photons that may originate from autofluorescence or from out of focus probes.
- **Noise** – statistical uncertainties associated with the detection of fluorescence. Typically appear as fine grains.

Bottlenecks of Early Fluorescence Optics

Optics – Dark field Illumination

High background, Limiting objective NA, oil immersion

Probes – Few

Bleaching, Limited reaction targets, Limited spectral ranges

Detectors – Photographic film

Low sensitivity, Long exposure

Legacy (Diascopic) Design for Fluorescence Microscopy

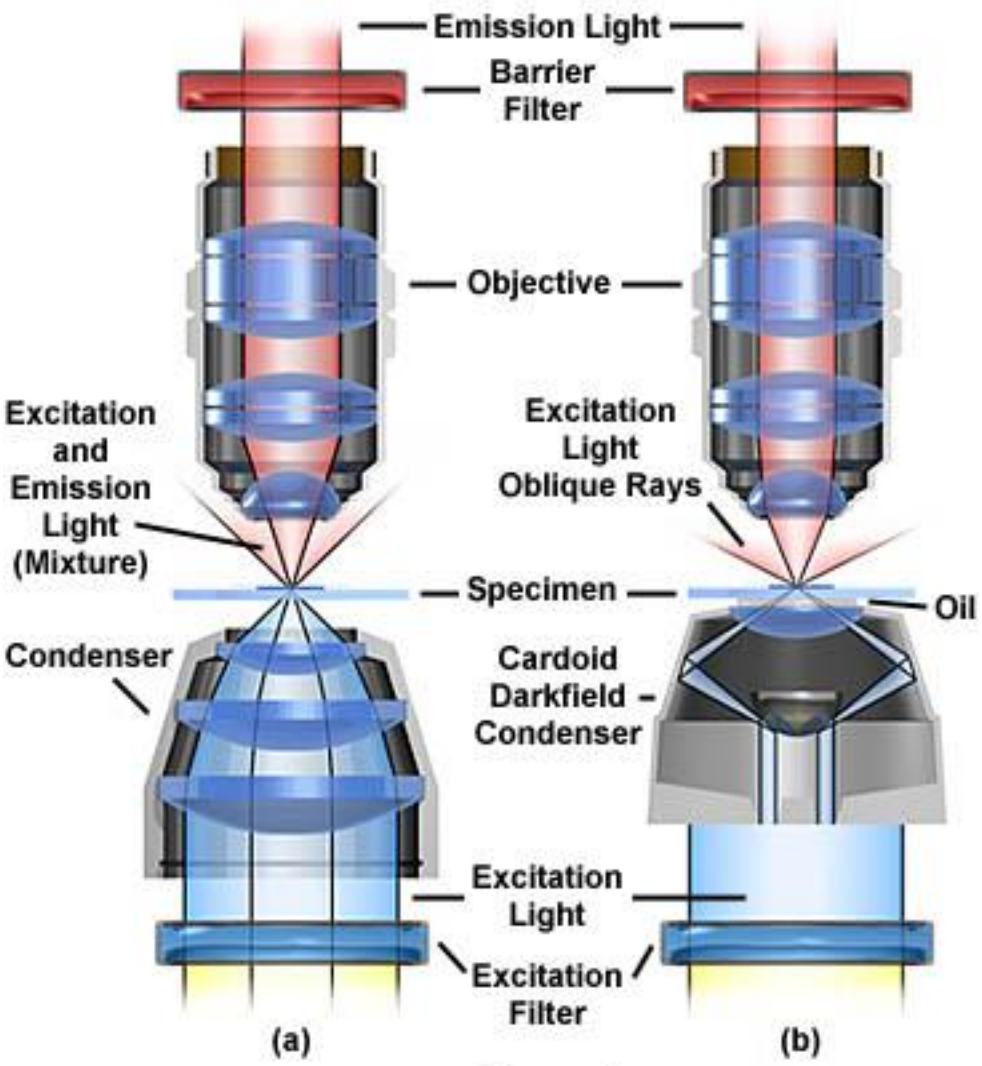


Figure 1

(bright field) (dark field)

Optical Design in Epi-Fluorescence Microscopy

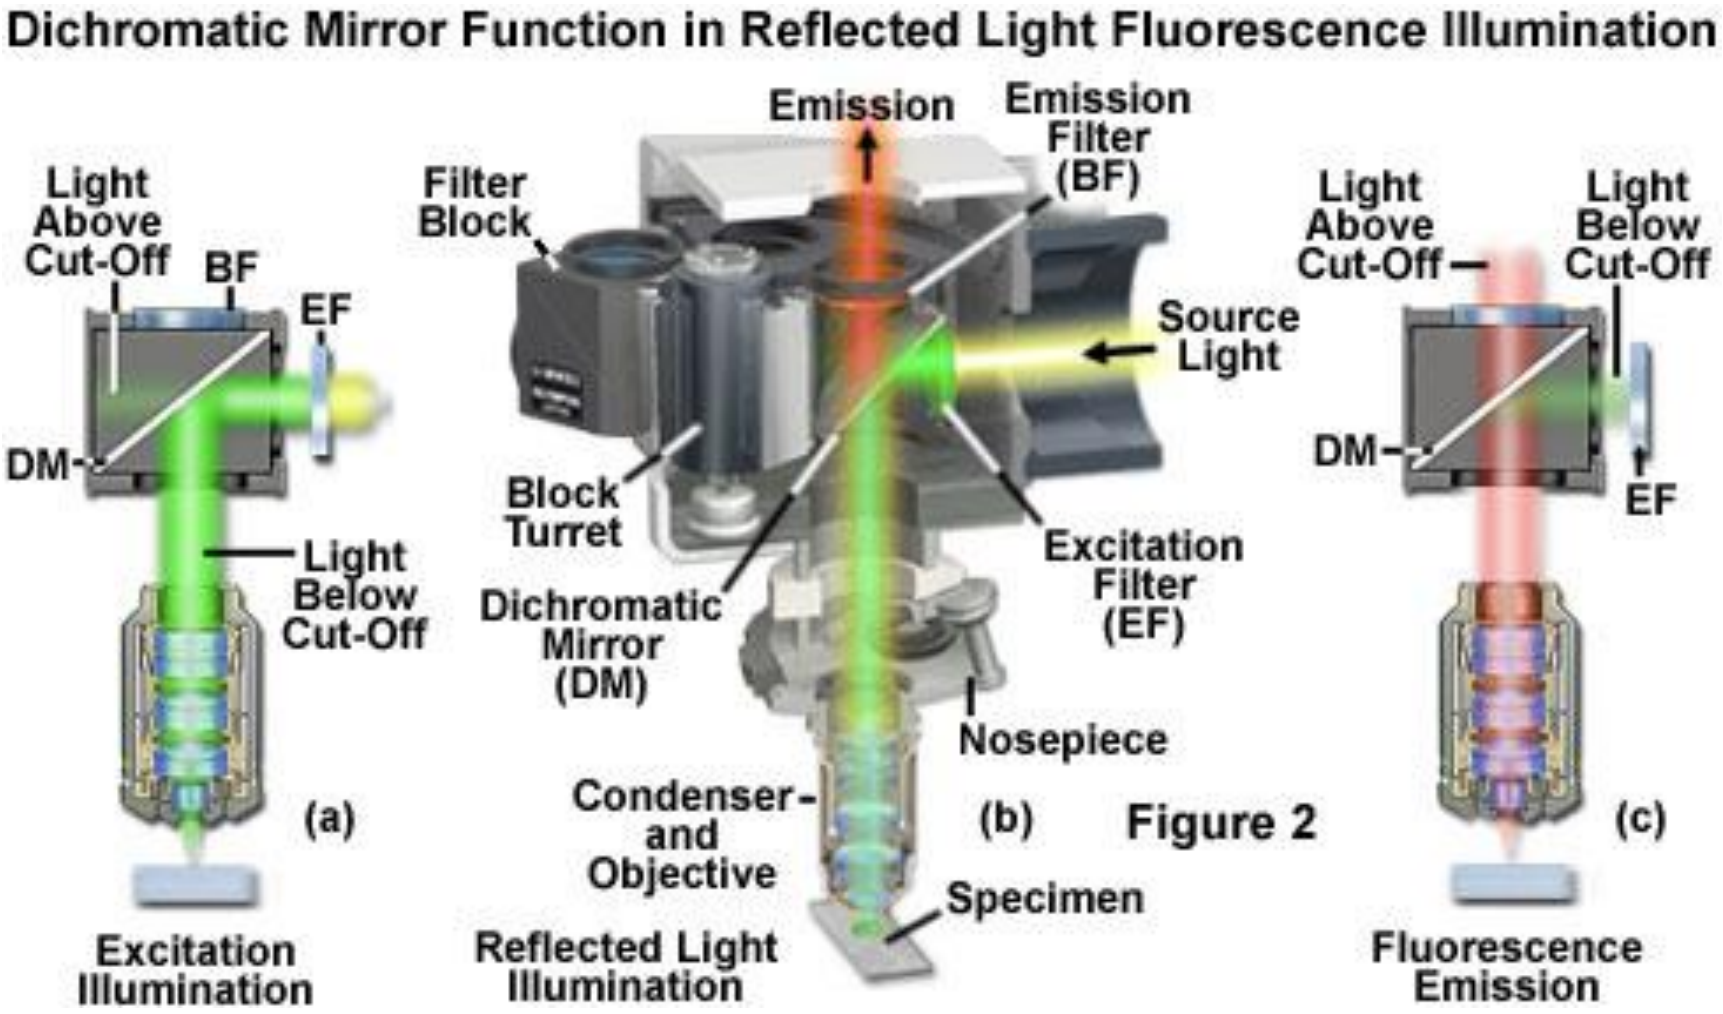

Figure 2

Bottlenecks of Early Fluorescence Optics

Optics – Dark field Illumination

High background, Limiting objective NA, oil immersion

Epi-Illuminator (physics)

Probes – FITC

Bleaching, Limited reaction targets, Limited spectral ranges

New bleaching-resistant dyes, sulfhydryl reagent, Indicator dyes, etc (chemistry)

Detectors – Photographic film

Low sensitivity, Long exposure, Tedious

Intensified video cameras (engineering)

Fluorescent Probes of Calcium Ion

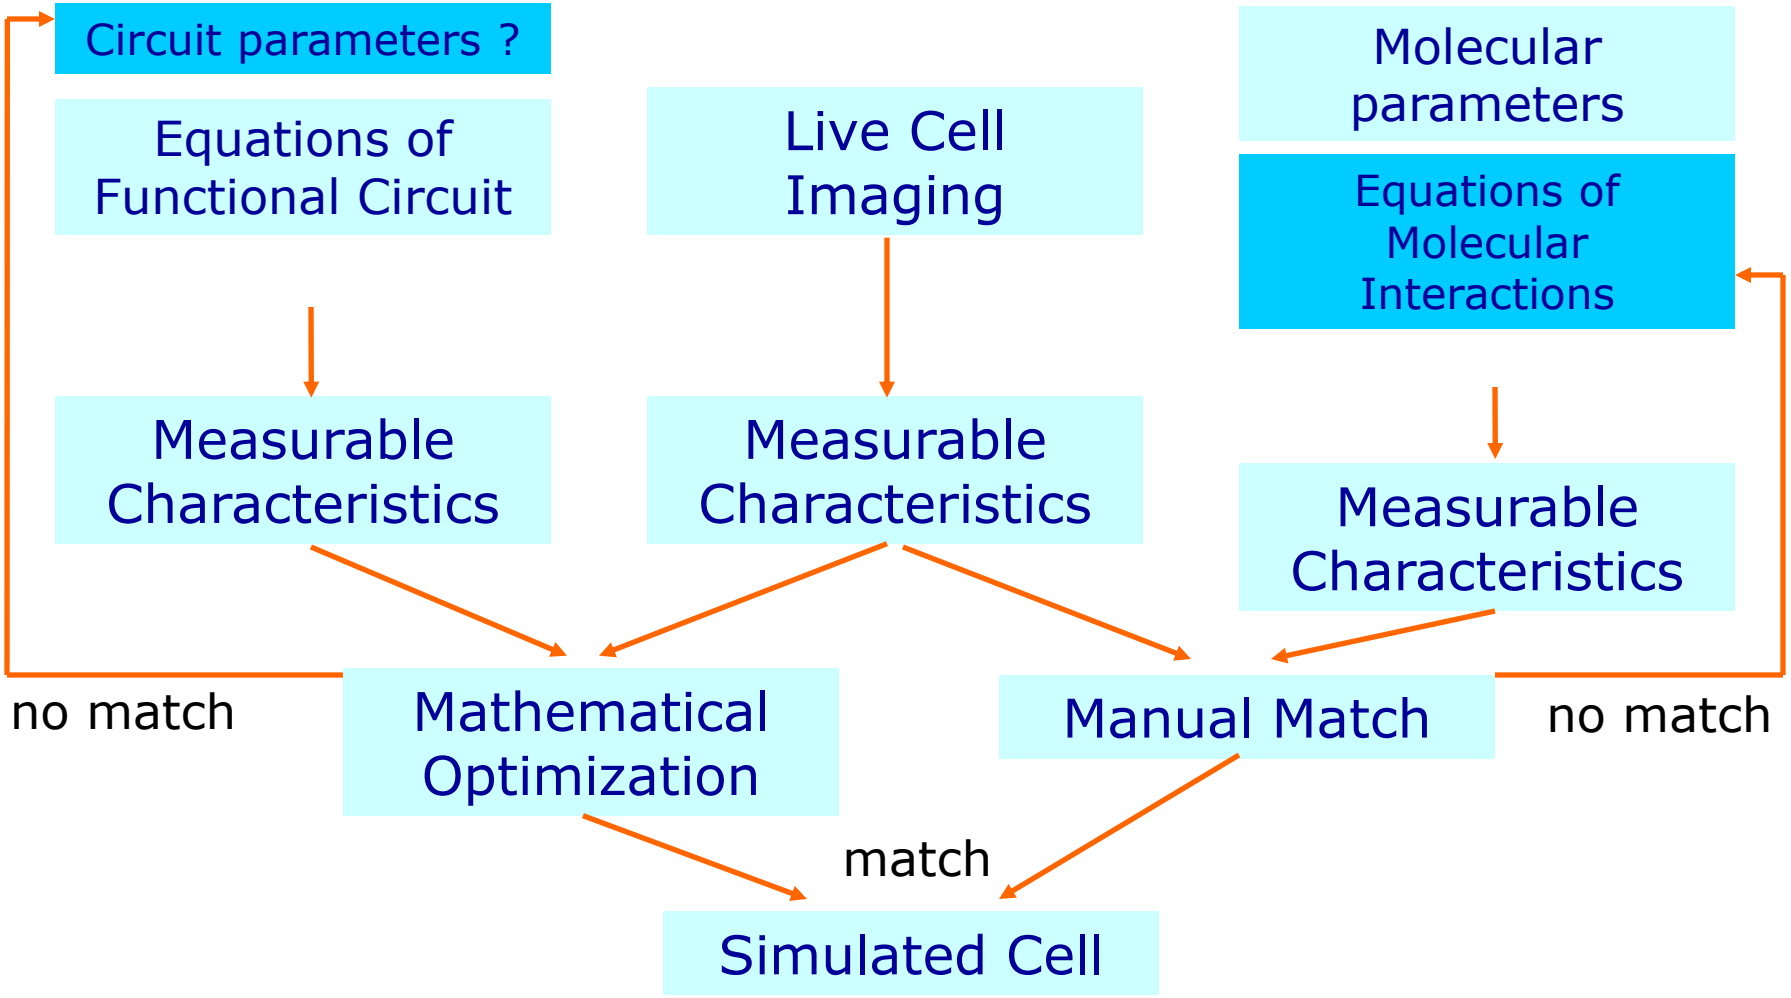
Original Signal Noise

From “Seeing” to “Understanding”

- What Biologists Can See with Light Microscopy -
  - Spatial and temporal details of chemical and physical properties encoded by optical sensors
- What Biologists Need for Understanding -
  - The rules of interactions that lead to biological functions
- Images Represent Manifestations or Consequences of Functions, Not the Function Itself
- Images Represent Local Information Presented in Tandem, Functions Often Require the Integration Across Space and Time

Understanding by Modeling



Modeling Microscope Images

Based on Biological Mechanisms and Instrumental Characteristics

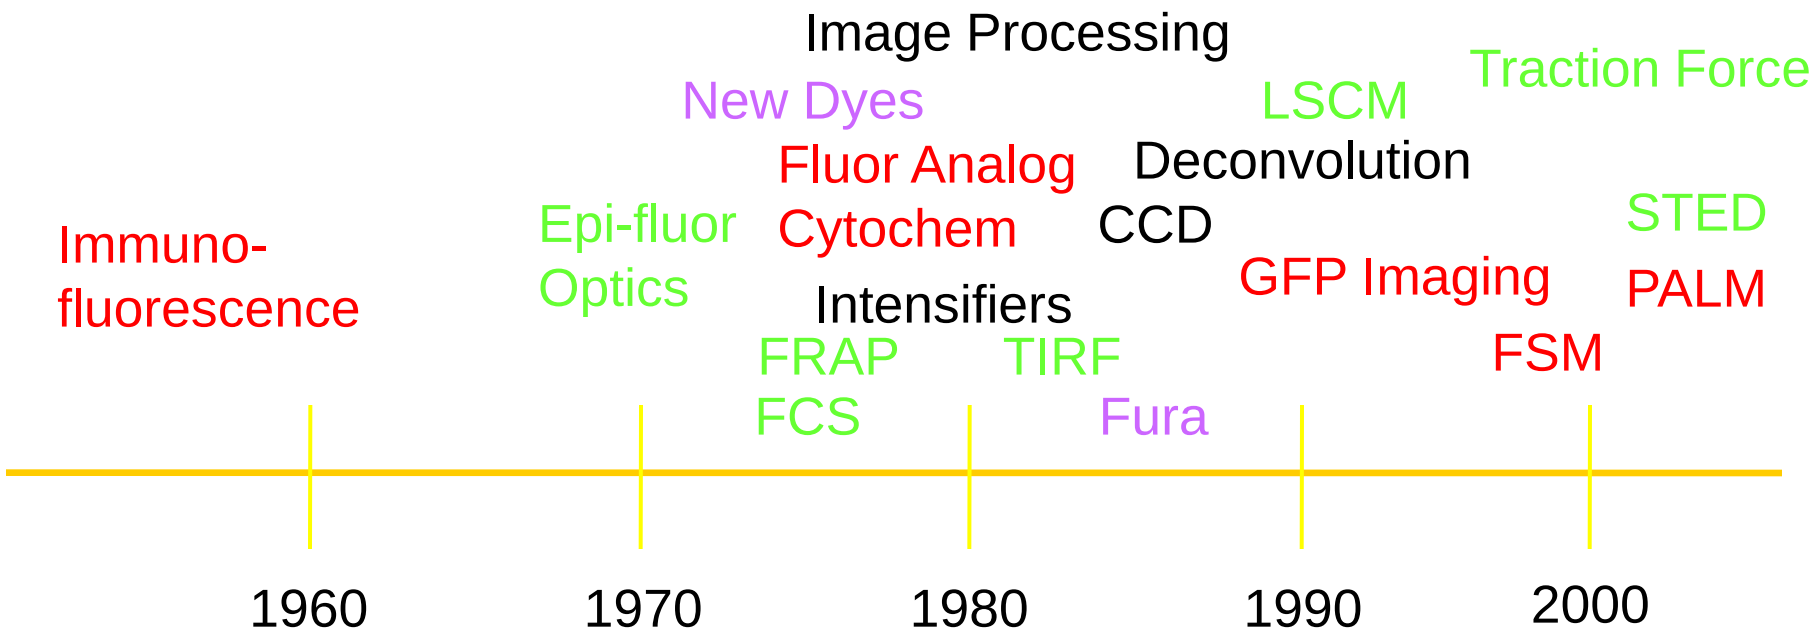
Fluorescence Microscopy Timeline



Concluding Remarks

Learning from the Recent History of Light Microscopy

- Breakthroughs often come from merging physical, biological, chemical, and engineering approaches.
- Much untapped potential exists in other disciplines, waiting to be imported for fluorescence microscopy.
- Simple schemes have the greatest potential for the widest, fastest dissemination and impact.
