

Exam 3 will be taken on the last Thursday in the cluster. You will have the entire class time to do the exam. If you finish early, you may leave or stay and work. If you do not finish by 1:20, you will not receive extra time.

This exam will be very different.

You will write one program. The program will involve animation and must display a set of visual behaviors. These behaviors will be displayed for you at the beginning of class.

While the two sample programs provided in this folder do not require any form of user input, your exam may require such input.

The problems will focus on the concepts of programming AND animation with Processing that were presented in Homeworks 1 through 10.

The exam is open API, open notes, open Open-Processing, open book. You may NOT use any form of “living” help during the exam.

We will, where possible help you with syntax errors but we will not help you with logic problems.
