CONTRIBUTIONS TO RESEARCH, EDUCATION AND PROFESSIONAL LEADERSHIP

Professor Zhang's research focuses on computational geometry, mesh generation, image processing, finite element method (FEM), isogeometric analysis (IGA) and data-driven modeling with broad applications in computational biomedicine and engineering. She has made fundamental and innovative contributions in three main areas:

- (1) Image-based geometric modeling and mesh generation for complex domains. In scanned images, the domain of focus often possesses complicated geometry, topology, and sometimes heterogeneous materials at various scales. Professor Zhang has created the first systematic computational framework for high-fidelity geometric modeling and mesh generation with unique features different from other existing methods: image-based meshing for heterogeneous domains with topology ambiguity resolved; multiscale geometric modeling for biomolecular complexes; all-hexahedral meshing with sharp feature preservation for CAD assemblies; robust quality improvement for non-manifold meshes; and guaranteed-quality mesh generation with feature preservation.
- (2) Volumetric spline modeling and IGA. Professor Zhang's research on analysis-suitable volumetric spline modeling from boundary representations is contributing to the integration of design and analysis, the root idea of IGA, and leading to great advances in computational mechanics. Her contributions include converting arbitrary unstructured quadrilateral/hexahedral meshes to T-spline surfaces/solids; polycube-based parametric mapping schemes to construct volumetric T-splines for genus-zero and arbitrary genus geometry; feature preservation using Boolean operations, skeleton and eigenfunction-based vector fields; truncated subdivision schemes to handle extraordinary nodes for arbitrary topology; as well as developing new analysis-suitable basis functions such as truncated T-splines, blended B-splines and hybrid non-uniform Catmull-Clark subdivision.

- (3) Novel FEM and IGA applications in biomedicine and engineering. Professor Zhang has made innovative contributions in broad biomedical and engineering applications: material transport and traffic jam in complex neurites; neural growth, neurological disorders and biological circuits design; image-based adolescent idiopathic scoliosis modeling and data-driven deformity prediction; multiscale modeling for Ca^{2+} signaling in ventricular myocytes; cardiovascular modeling and simulation; dynamic lung modeling and tumor tracking for image-guided radiation therapy; critical feature determination of polycrystalline materials; and hybrid IGA-FEA of fiber reinforced thermoplastic composites design. She is currently leading a new research effort of combining physics-based simulation with machine learning to explore novel applications in neuron computation and 3D/4D printing.

Professor Zhang's research provides engineers/scientists with novel technologies to construct high-fidelity, multiscale models for complicated domains, which have dramatically advanced our predictive capability of physical/biological phenomena at molecular, cellular, tissue and organ scales. Her image-based geometric modeling and mesh generation methods are widely applied across the biomedicine and engineering community by medical centers and DoD labs. Her unique all-hexahedral mesh generation and spline modeling techniques have been incorporated into commercial software such as Rhino, Abaqus and Ansys LS-Dyna, and have contributed significantly to flexible geometry and meshing software infrastructure development in Navy, NAVAIR, Army and Honda research. Her high-fidelity modeling and simulation techniques and software have been adopted by Mayo Clinic, Honeywell Federal Manufacturing & Technologies LLC, Technical Data Analysis, Inc and Global Engineering and Materials, Inc through collaborative projects. She has founded a startup HexSpline3D LLC to commercialize her technologies. Her innovative biomedical and engineering applications have been leading her field to new breakthroughs and discoveries.

As a professor at CMU, Professor Zhang has made significant contributions to education and research. She teaches the required core course "Numerical Methods" at both undergraduate and graduate levels.
