48-749 Special Topics Parametric Modeling with BIM Fall Semester 6-12 units • R1.30-4.30• MM102

> Carnegie Mellon University School of Architecture

Instructor: Ramesh Krishnamurti ramesh@cmu.edu

Co-Instructor: Tsung-Hsien Wang tsunghsw@andrew.cmu.edu

Co-Instructor: Tajin Biswas <u>tbiswas@andrew.cmu.edu</u>

Lecture 1

- Course introduction
- What is BIM ?
- How we use it
- Overview of Revit 2009/2010

Course Introduction

- This course is to prepare students for modeling architectural geometry through development of parametric schemes for architecture applications.
- For students with no programming background, this course is a half-semester course, which supplies the basis of understanding parametric geometric construction mechanisms.
- For all students, the full semester course is regarded as the venue for pursuing individual projects relating to advanced geometric constructions with parametric computation.
- The course will use Revit Architecture 2010, and .NET framework.

Course credit (6-12)

- All students are initially evaluated for 6 units (half-semester course). Students who score at least C+ at mid-semester may proceed to the full semester course for credit.
- The project and any accompanying preparatory assignments will be worth an additional 3 units.
- Students may add to their skill and degree of difficulty by completing a Revit-based advanced parametric modeling assignment for an additional 3 units.
 This is required of all Computational Design students.

Course Motivation

- BIM tools, such as Revit, offer a parametric 3D model which can generate information early in the design process (quantity take-offs, solar studies, day-lighting simulation, fabrication possibilities)
- With more parametric control over designed components designers can explore variations, analyze design artifacts, customize components for evaluation and be more efficient.

Course schedule

Date	Lecture and topic	Assignment
Week 1	Introduction to building information modeling	
08/27	Introduction to Revit Architecture 2010	
Week 2	BIM capabilities	AA A 1
09/03	Construction of a simple project	MAI
Week 3	BIM in the AECM domain	
09/10	Revit (Lighting Studies, Recycled content calc ⁿ)	MA I QUE/MA Z
Week 4	Type of families	
09/17	Revit Modeling 3d Families I	
Week 5	Categories and Parameters	
09/24	Revit Modeling 3d Families II	MA Z QUE/MA 3
Week 6	Encoding Design Rules	
10/01	Revit Modeling 3d Families III	
Week 7	Prototyping	
10/08	Revit Modeling 3d Families IV	MA 3 QUE

Course schedule

Date	Class	Assignment
Week 8	Introduction to .NET SDK	Project
10/22	Introduction to .NET SDK and C#	riojeci
Week 9	Introduction to Database	
10/29	Database and SQL	
Week 10	Databases used to automating modeling process	Project proposal
11/05	Databases I and II	Project proposal
Week 11	Databases used to automating modeling process	
11/12	Databases III and IV	
Week 12	LEED credit evaluation using:	
11/19	Databases I - IV	
Week 13	Thanksaiving Holiday (NO CLASS)	
11/25-27	manksgiving holiday (NO CLASS)	
Week 14	Project assistance	
12/03	rojeci ussisiunce	
Week 15	Review	Projects due
12/10	Final Presentation	

What is BIM

- The acronym BIM (Building Information Model(ing)) was coined in the early 2002 (attributed to Jerry Laserin though the concept predates this by at least 15 years)
- BIM relies on the creation and collection of interrelated computable information about a building project
- BIM processes revolve around virtual models that make it possible to share information through out the building industry

What is BIM

- These models are embedded with data, which, when shared among design team members, can reduce errors and facilitate an integrated process.
- The federal government has predicted savings of \$15.8 billion annually from an integrated process.
- Projects today using BIM properly save 5-12% on overall process costs

What is BIM?

- BIM is an information based system that builds long term value and advances innovation
 - It can improve how projects are designed and built
 - It improves the environment and builds economic value
- BIM can be looked at in this course as "Beyond Information Models" to understand the nature of the concept
- For clarity we will use bim to represent applications– Archicad, Microstation/GCand Revit bim tools

What BIM is not

- BIM is neither a single building model nor a single database (series of interconnected models and databases)
- BIM is not a replacement for people
- BIM is neither perfect nor a panacea

What BIM is not

- BIM is not 3D
- BIM does not have to be 3D.
- Example : A spread sheet can be a BIM
- BIM is not complete
- BIM is not a software application–
 (eg, Revit, ArchiCAD or Microstation/GC etc)

How BIM is used pragmatically

• As a distributed relational parametric database

So where does the knowledge manifest itself?

How BIM is used in this course

- Focus is on the power of bim tools mainly to evaluate facets of sustainable building design
- Using information from a BIM we are able to count, sort and calculate different requirements set by sustainable building rating systems
 - Material resources
 - Recycled material content
 - Water resources
 - Water usage and savings
 - Energy use
 - Energy use reduction by optimizing façade/envelope of building

How BIM is used in this course

- Sustainable building rating systems are defined as tools which examine the performance or expected performance of a 'whole building' and translate that examination into an overall assessment that allows for comparison against other buildings
 - LEED (Leadership in Energy and Environmental Design) USGBC
 - BREEAM (Building Research Establishment's Environmental Assessment Method) – UK
 - CASEBEE (Comprehensive Assessment System for Building Environmental Efficiency) – Japan

Overview of rating systems

General Assessment Area	LEED 3.0	Green Star	BREEAM
Management		Management	Management
Energy & Atmosphere	Energy	Energy	Energy
Emissions		Emissions	Pollution
Sustainable Sites	Sustainable sites	Land Use and Ecology	Land Use and Ecology
		Transportation	Transportation
Water Efficiency	Water Efficiency	Water	Water

Indoor Air Quality	Indoor Air Quality	Indoor Environmental Quality	Health and Well Being
Indoor Air Quality Quality of Service	Indoor Air Quality	Indoor Environmental Quality	Health and Well Being
Indoor Air Quality Quality of Service Materials and Resources	Indoor Air Quality Materials and Resources	Indoor Environmental Quality Materials	Health and Well Being Materials
Indoor Air Quality Quality of Service Materials and Resources Innovations	Indoor Air Quality Materials and Resources Innovations	Indoor Environmental Quality Materials Innovation	Health and Well Being Materials

Structure of our Application

Revit as a bim software

- Creates a 3D 'parametric' model which produces an abstraction of plans, elevations, sections and schedules using databases.
- Propagates and manages changes throughout these databases so that a change to any part of the database is reflected in all other associated parts of the database
- Captures and preserves information for collaboration and reuse by additional industry-specific applications

Revit as a bim software

- Bidirectional Associatively
- All views (eg, plan, section, schedule) use the same database
- No updates needed (automatic)
- Parametric Relationships
 - Software manages and coordinates changes

Example:

You have equally spaced windows across an elevation. Length of elevation changes. The spacing between the windows changes but the relationship of equal spacing is maintained

Revit vs. AutoCAD

- Revit is a true architectural model (not just geometry)
- Revit is parametric
- Revit uses "families" not blocks (eg, doors, windows)
- Revit uses alignment instead of osnaps
- Revit has multiple design views (plan, elevation, perspective, section)

Revit vs. AutoCAD

- No command line or layers in Revit
 - Visibility controlled by categories
- Revit uses single file, multiple users projects
- Revit imports/exports AutoCAD file type (.DXF and .DWG)

Revit Fundamentals

Revit Parametric Elements

- Every Element in Revit is considered a family
- Each family belongs to a category

Revit Fundamentals

Revit Fundamentals- Model

Views are considered parametric elements

Properties can be defined to display information

Schedules are also abstract ways to view a model

Revit Fundamentals- Parametric element

- A parametric element is something which can change size, material and graphic look but is still the same fundamental element.
- Most elements in Revit allow for the creation of variations of a base type.
 - Example each type of door typically represents a variation in size, material, color, but is derived from the same **family**
- Type parameters affect all instances in the same family
- Instant parameters affect only the selected instance

Revit Families

- System Families
- Component Families
- In-Place Families
- Difference lies in their creation methods, in what context they are created and the types of parameters available

Revit Families- System Families

- They are made of limited categorieswalls, roofs, floors, ceilings, stairs, railings, mechanical equipments and topo surfaces
- They have different creation methods:
 - Walls draw/place a wall
 - Floor/Roof has to be in Sketch Mode then it generates a 3D model
 - Floors and railings more detail in Sketch Mode that has additional features that floors do not have

Revit Families- Component Families

- Components or standard families are created outside the project environment using the family editor.
 These are stored in an external library which can be loaded into the project.
- > Each component belongs to a specific Revit category.
- They have their own extension .rfa

Revit Families- Component Families

Go to insert tab > Choose Load Family

Revit Families- In Place Families

- In place families are custom elements that are specific to a project and the conditions of the project.
- The model grays out and becomes in-selectable when such families are made.
 - Example, a non vertical wall shape or skewed mullion
- These can be copied from project to project
- These do not interface well with energy modeling, day lighting tools or direct-to-fabrication.
